

DYNA PRO

This information was generated by Gold Director Rowan Emrys, C.N.M.T., an independent distributor for DYNAMITE® Specialty Products. The views expressed herein do not necessarily reflect those of DYNAMITE® MARKETING, Inc. No claims are expressed or implied, and this information is not intended to diagnose, prescribe or cure.

This is one of those products which is superb for all animals that drink water, fish and amphibians excepted! **Dyna-Pro** may be added to feed, put in water, or drenched directly into mouths; whichever works best for the situation.

While other probiotic formulas merely supply one or more strains of live beneficial bacteria, the use of which can result in bloating, **Dyna-Pro** uses a fermentation extract which nourishes and encourages the naturally available beneficial bacteria to reproduce and multiply. A few years ago we spoke to a German Grand Prix (dressage) visitor and asked him what they fed their horses to keep them so healthy and colic-free. His answer was "silage." Silage is a fermentation product and it is this that keeps their intestines so healthy. In this country, we do not feed silage but the **DynaPro** should more than make up for that.

It comes down to the intestinal pH balance. Without correct, alkaline pH, the beneficial intestinal bacterial colonies will not thrive and can go dormant. These "good" bacteria are our horses' first defense against such "invaders" as viruses, "bad" bacteria and parasites so it behooves us to encourage healthy colonies. Of course, the "invaders" really are always around just waiting for an opportunity to come out of their dormancy and take advantage of a weakened, or acidic, condition. With horses, many stressors can cause an acidic gut including but not limited to: weather changes, hauling, competition, being scared, drinking chlorinated water, etc. making the use of **DynaPro** even more important at these times.

It depends somewhat on the stability of the individual horse for emotional factors, but

- We give it daily to all equine youngsters under the age of 2 since their digestive tracts are not mature until then. It is also a daily given for all geriatrics whose intestines seem to slow down and need a little extra boost. Mature, healthy pasture potatoes may do fine with a dose once a week, but working horses also will also need it daily.
- All medications/vaccinations affect every horse (or other critter) so use **Dyna-Pro** before and after worming or vaccinating or any other medications.
- One DYNAMITE® Director who lives nearby says: "My family travels the High School and Little

*Britches Rodeo circuit. Our experiences with colic and **Dyna-Pro** have caused us to speak of **Dyna-Pro** as the 'Super Stuff'! . . . A roping horse had been thru a long haul from up in the mountains down to the plains in hot, muggy weather. Signs of colic stated at 10 AM, owner called the vet, and by 10:30 the horse was very distressed and we became involved. We gave 12 cc of **Dyna-Pro**. At 10:45 the horse appeared extremely hungry and showed no signs of tummy distress. Repeated **Dyna-Pro** 11 AM, vet arrives, no evidence of colic. At the 95 Little Britches National Finals, one of the horses that we worked on (for colic) went on to win the National Barrel Racing Championship."*

- Many others have had similar experiences with halting the onset of simple gas colic with the immediate syringing in of 12 cc's or so of **DynaPro** every 15-20 minutes until symptoms abate.
- It is the first thing we reach for or suggest with any digestive problems including scours in colts. Bottle-fed calves also benefit greatly from the addition of **DynaPro** to their formula.
- Many poultry growers have found the addition of **DynaPro** to their flocks' drinking water aids in shell strength and chick viability.
- Rabbit breeders who have also been amazed at the increased health, coat condition, and weight gains of their stock after the addition of **DynaPro** to their programs.
- A number of Humane Societies and rescue operations have found that adding **DynaPro** to the diet of any rescue animal but especially the babies (birds or mammals), has resulted in the saving of many more creatures.
- Also, there seems to be a correlation between inefficient protein digestion and fly attraction; many have found the addition of **DynaPro** to a critter's feed takes care of flies.
- Many humans have also ingested it, although it is formulated and approved for animals only, when traveling to avoid intestinal upset.
- It aids digestion of any feed given thus offsetting deleterious effects of preservatives, other chemicals, poor mineral balance, etc.

DYNA PRO HAS BEEN USED SUCCESSFULLY with just about any species and should be considered an essential addition to any feeding program. ■
