No claims are expressed or implied, and this information is not intended to diagnose, prescribe or cure.

If you feed grain, this is by far the finest **Pelleted Grain Ration** available. Grown on their own **HumiZyme**-fertilized fields, the grains are not only naturally packed with nutrients/minerals and certified non-GMO, but also are free of pesticides, herbicides, and storage chemicals since they are milled in a **DYNAMITE<sup>®</sup>** chemical-free mill.

Normally mills add numerous chemicals to discourage rodents, mold, etc. and these can be residual in the feeds. In 2003, there were many Alpaca breeders forced out of business due to residue-laced grain fed to their alpacas who are a bit more sensitive than horses to such additives. Even though we cannot necessarily see the damage as with the Alpacas, we believe it is weakening equine stock on a cellular basis.

In addition to superior grains, **PGR** also contains a goodly amount of **Miracle Clay**: 20# per ton of feed. The clay can absorb toxins from the body and is something for which horses would forage if they could. This is helpful since horses eat very close to the ground and many soils contain relatively large amounts of mercury in the top inch or so of soil. If a horse absorbs too much, it can cause serious problems. The clay content also is very soothing to ulcers which so many horses suffer from today.

Another unique ingredient in the **PGR** is **HES** (High Energy Supplement), a full fat (lecithin) chemical-free extruded soybean meal which is also available separately for those horses requiring higher caloric values without adding more carbohydrates.

Also contained within the **PGR** is a vitamin/mineral pac. Although horses really need more to be optimally fed, this lower amount allows owners to adjust amounts of **Regular** or **Plus** for individual needs making this one feed appropriate for all horses from foals to geriatrics and everything in between.

So throw away those chemical-laden mixes:

Foal Feed  
Weanling Feed  
Active Horse Feed  
Mature Horse Feed  
Geriatric Horse Feed  
Pregnant Mare Feed  
Lactating Mare Feed

This one pellet does it all! Simply adjust amounts of both this sweet-smelling pellet and of top-dressed

**DYNAMITE<sup>®</sup> Regular** or **Plus**, and you have a specially mixed feed for your individual equine needs.

Most mature horses will do fine on only a handful to a cup per day while active, competition horses and lactating mares will require larger amounts - sometimes up to 2 qts (3#) per feeding for a 1000# horse. Horses requiring more should have more feedings per day rather than increasing each feeding over approximately 3# or .03\$ of horse's body weight.

For horses with severe dental problems or even toothless or sick, the **PGR** can easily be "souped" up by adding varying amounts of water. The pellets break down immediately in the moisture (in mouths, too) making them safe even for horses who have "choked" in the past.

Many people, including us, have tried in vain to duplicate these pellets by mixing various proportions of store-bought grains and adding **Plus**, **Clay** and **HES**, but it simply does not end up being the same. Even distributors in Alaska and Florida, which are quite costly to ship to, insist on the **PGR** because of its incredible synergy of formula and the results that are easily observed. Even they find it cost-effective to feed because so little is needed to produce such large positive results. In fact most owners find their feed bills *reduced* overall after they put their horses on the **PGR**. They discover their horses are doing beautifully on about *half* the amount, or less, by weight than their previous feed.

This is a superior grain for any grain-eating species whether cattle, sheep, goats, exotics, or even rabbits or guinea pigs! Even most insulin-resistant, Cushing's disease stock or ponies/burros can consume small amounts of this pure pelleted grain.

The most cost-effective way to purchase it is in ton lots if you have appropriate storage for it and where it will not be held more than three months. No live food without chemical preservatives should be held longer than that without risking deterioration of nutrients. If tonnage is beyond your storage or checkbook capabilities, the 6-pac is the next most cost-effective way to obtain **PGR** since it can be shipped/drop-shipped in a regular order with UPS.

WE WILL *NEVER* GO BACK to standard grains after experiencing the difference. It is *that* simple! ■
